# Fluids/Lytes/Nutrition

ANNA G MEADER

GENERAL SURGERY LECTURE 10.13.22

# Total Body Water

- ▶ Roughly  $\frac{2}{3}$  of total body weight is water (**men**); **infants** have a little more body water, **women** have a little less
- ▶  $\frac{2}{3}$  of water weight is intracellular (mostly muscle)
- ▶  $\frac{1}{3}$  of water weight is extracellular
  - ▶  $\frac{2}{3}$  of extracellular water is interstitial
  - ▶  $\frac{1}{3}$  of extracellular water is in plasma

- 
- ▶ **Volume overload** – most common cause is iatrogenic; first sign is **weight gain**
  - ▶ **0.9% normal saline**: Na \_\_\_\_ and Cl \_\_\_\_
  - ▶ **Lactated Ringer's solution**
    - ▶ **(LR; ionic composition of plasma)**: Na 130, K 4, Ca 2.7, Cl 109, bicarb 28
  - ▶ **Plasma Osmolarity**:
    - ▶  $(2 \times \text{Na}) + (\text{glucose}/18) + (\text{BUN}/2.8)$
    - ▶ Normal: 280 – 295

- 
- ▶ **Volume overload** – most common cause is iatrogenic; first sign is **weight gain**
  - ▶ **0.9% normal saline**: Na 154 and Cl 154
  - ▶ **Lactated Ringer's solution**
    - ▶ **(LR; ionic composition of plasma)**: Na 130, K 4, Ca 2.7, Cl 109, bicarb 28
  - ▶ **Plasma Osmolarity**:
    - ▶  $(2 \times \text{Na}) + (\text{glucose}/18) + (\text{BUN}/2.8)$
    - ▶ Normal: 280 – 295

# Estimates of Volume Replacement

- ▶ 4 cc/kg/hr for 1<sup>st</sup> 10 kg
  - ▶ 2 cc/kg/hr for 2<sup>nd</sup> 10 kg
  - ▶ 1 cc/kg/hr for each kg after that
  - ▶ Best indicator of adequate volume replacement is
-

- 
- ▶ 4 cc/kg/hr for 1<sup>st</sup> 10 kg
  - ▶ 2 cc/kg/hr for 2<sup>nd</sup> 10 kg
  - ▶ 1 cc/kg/hr for each kg after that
  - ▶ Best indicator of adequate volume replacement is **urine output**
  - ▶ **Other indicators?**

- 
- ▶ During open abdominal operations, fluid loss is \_\_\_\_\_ unless there are measurable blood losses
  - ▶ Usually do not have to replace blood lost unless it is **>500cc**
  - ▶ **Insensible fluid loss** – 10 cc/kg/day, 75% skin, 25% respiratory, pure water

- 
- ▶ During open abdominal operations, fluid loss is 0.5 – 1.0 L/hr unless there are measurable blood losses
  - ▶ Usually do not have to replace blood lost unless it is **>500cc**
  - ▶ **Insensible fluid loss** – 10 cc/kg/day, 75% skin, 25% respiratory, pure water

- ▶ **IV replacement after major adult gastrointestinal surgery**

- ▶ During operation and 1<sup>st</sup> 24 hours, use \_\_\_\_

- ▶ After 24 hours, switch to \_\_\_\_\_

- ▶ 5% dextrose will stimulate insulin release, resulting in amino acid uptake and protein synthesis (also prevents protein catabolism)

- ▶ D5 1/2 NS @ 125/hr provides 150 gm glucose per day (525 kcal/day)

- 
- ▶ **IV replacement after major adult gastrointestinal surgery**
    - ▶ During operation and 1<sup>st</sup> 24 hours, use **LR**
    - ▶ After 24 hours, switch to **D5 ½ NS with 20 mEq K<sup>+</sup>**
      - ▶ 5% dextrose will stimulate insulin release, resulting in amino acid uptake and protein synthesis (also prevents protein catabolism)
      - ▶ D5 ½ NS @ 125/hr provides 150 gm glucose per day (525 kcal/day)

# GI Fluid Secretion

- ▶ Stomach                    1 – 2 L/day
  - ▶ Biliary system            500 – 1000 ml/day
  - ▶ Pancreas                    500 – 1000 ml/day
  - ▶ Duodenum                 500 – 1000 ml/day
- 
- ▶ **Normal K<sup>+</sup> requirement:** 0.5 – 1.0 mEq/kg/day
  - ▶ **Normal Na<sup>+</sup> requirement:** 1 – 2 mEq/kg/day

# GI Electrolyte Losses

- ▶ Sweat – hypotonic
- ▶ Saliva –  $K^+$  (highest concentration of  $K^+$  in body)
- ▶ Stomach –  $H^+$  and  $Cl^-$
- ▶ Pancreas –  $HCO_3^-$
- ▶ Bile –  $HCO_3^-$
- ▶ Small intestine –  $HCO_3^-$ ,  $K^+$
- ▶ Large intestine –  $K^+$

- ▶ **Gastric losses** – replacement is:
  - ▶ D5 ½ NS with 20 mEq K<sup>+</sup>
- ▶ **Pancreatic/biliary/small intestine losses** – replacement is:
  - ▶ LR
- ▶ **Large intestine (diarrhea) losses** – replacement is:
  - ▶ LR
- ▶ **GI losses** – replacement rate should be:
  - ▶ **cc: cc**
- ▶ **Urine output** – should be kept at least 0.5 cc/kg/hr; should not be replaced, usually a sign of normal postoperative diuresis
  - ▶ New trends that for a person < 100kg, 30cc/h periop is acceptable

# Potassium

- ▶ **HyperK** – peaked T waves initial finding on EKG
  - ▶ **Calcium gluconate** ( membrane stabilizer for heart)
  - ▶ **Sodium bicarbonate** (causes alkalosis, K enters cell in exchange for H)
  - ▶ **10 U insulin and 1 ampule of 50% dextrose** (K driven into cells along with glucose)
  - ▶ **Kayexalate**
  - ▶ **Dialysis** if refractory
- ▶ **Hypokalemia** – T waves disappear
  - ▶ May need to replace Mg<sup>+</sup> before you can correct K<sup>+</sup>
- ▶ Replacement

# Sodium

- ▶ **Hypernatremia** – restlessness, irritability, ataxia, seizures
  - ▶ Correct with D5W slowly to avoid brain swelling
    - ▶ 8-10 mEq per day
  - ▶ Total free water deficit =  $0.6 \times \text{patient's wt (kg)} \times [(\text{Na} +/140) - 1]$

# Sodium

- ▶ **Hyponatremia** – headache, delirium, seizures, nausea, vomiting
  - ▶ Na deficit =  $0.6 \times (\text{weight in kg}) \times (140 - \text{Na})$
  - ▶ \_\_\_\_\_ is the first treatment for hyponatremia, then **diuresis**, then NaCl replacement
  - ▶ Correct Na slowly to avoid central pontine myelinosis (**no more than 1 mEq/hr**)
  - ▶ \_\_\_\_\_ **can cause pseudohyponatremia** – for each 100 increment of glucose over normal, add 2 points to the Na value
  - ▶ SIADH results in hyponatremia

# Sodium

- ▶ **Hyponatremia** – headache, delirium, seizures, nausea, vomiting
  - ▶ Na deficit =  $0.6 \times (\text{weight in kg}) \times (140 - \text{Na})$
  - ▶ **Water restriction** is the first treatment for hyponatremia, then **diuresis**, then NaCl replacement
  - ▶ Correct Na slowly to avoid central pontine myelinosis (**no more than 1 mEq/hr**)
  - ▶ **Hyperglycemia can cause pseudohyponatremia** – for each 100 increment of glucose over normal, add 2 points to the Na value
  - ▶ SIADH results in hyponatremia

# Calcium

- ▶ Normal 8.5 –10.0; Normal Ionized Ca 4.4 – 5.5
- ▶ **Hypercalcemia** (Ca usually > 13 or ionized > 6 –7)
  - ▶ Breast cancer most common malignant cause
  - ▶ No lactated Ringer's (contains Ca + +)
  - ▶ No thiazide diuretics (these retain Ca + +)
  - ▶ Tx: NS at 200-300 cc/hr, Lasix
    - ▶ For malignant disease → mithramycin, calcitonin, aldaronic acid, dialysis
  - ▶ Replacement

# Calcium

- ▶ **Hypocalcemia** (Ca usually  $< 8$  or ionized Ca  $< 4$ ) – hyperreflexia, Chvostek's sign (tapping on face produces twitching), perioral tingling and numbness, Trousseau's sign (carpopedal spasm), prolonged QT interval
  - ▶ May need to **correct Mg** before being able to correct Ca
  - ▶ **Protein adjustment for calcium** – for every 1 g decrease in protein, add 0.8 to Ca

# Magnesium

- ▶ Normal 2.0 – 2.7
- ▶ **Hypermagnesemia** – causes lethargic state; burn, trauma, and renal dialysis patients
  - ▶ Tx: calcium
- ▶ **Hypomagnesemia** – signs similar to hypocalcemia
- ▶ Replacement

# Acute Renal Failure

- ▶ **FeNa** = (urine Na/Cr) / (plasma Na/Cr) –
  - ▶ best test for azotemia
- ▶ **Prerenal** – FeNa < 1%, urine Na < 20, BUN/Cr ratio >20, urine osmolality >500mOsm
  - ▶ 70% of renal mass must be damaged before ↑ Cr and BUN
- ▶ **Contrast dyes** – volume expansion best prevents renal damage:  $\text{HCO}_3^-$ , IV hydration.
- ▶ **Myoglobin** – converted to ferrihemate in acidic environment, which is toxic to renal cells
  - ▶ Tx: hydration, less evidence for urine alkalization
  - ▶ Goal UOP?
    - ▶ 0.5cc/kg/h

# Postoperative goals

- ▶ Post-op Electrolyte Ranges:

- ▶  $K^+ \geq 4.0$

- ▶ Phos  $\geq 3.0$

- ▶ Mg  $\geq 2.0$

# Calories

- ▶ 25kcal/kg typical for critically ill patient
- ▶ Ideal body weight
- ▶ Protein requirement varies based on indication
  - ▶ Healthy patients: 0.8g/kg/d
  - ▶ Critically ill: 1.5g/kg/d
  - ▶ Up to 2.5g/kg/d for severe catabolism (eg burns)

# Macros

- ▶ Lipids
  - ▶ 9.1kcal/g
- ▶ Glucose
  - ▶ 3.7kcal/g
- ▶ Protein
  - ▶ 4kcal/kg
  
- ▶ Oxidation of all three nutrients determines whole-body O<sub>2</sub> consumption, CO<sub>2</sub> production, heat production

# Calorimetry

- ▶ Indirect calorimetry: “Metabolic cart,” measured inhaled/exhaled O<sub>2</sub>/CO<sub>2</sub>, determine resting energy expenditure (REE)
  - ▶ Complicated, carts are tedious
- ▶ Multiple equations exist to estimate REE without a cart
  - ▶ THE SIMPLEST:
    - ▶ REE (kcal/d) = 25 ( body weight in kg)
  - ▶ Body weight adjustments proposed for obese/superobese patients, no clear consensus

# Respiratory Quotient

- ▶  $\text{CO}_2$  produced:  $\text{O}_2$  consumed
  - ▶ Measurement of energy expenditure
- ▶ Pure fat: RQ 0.7
- ▶ Pure Protein: RQ 0.8
- ▶ Pure carbohydrate: RQ 1.0
- ▶  $\text{RQ} > 1$ 
  - ▶ ?
- ▶  $\text{RQ} < 0.7$ 
  - ▶ ?

# Respiratory Quotient

- ▶  $\text{CO}_2$  produced:  $\text{O}_2$  consumed
  - ▶ Measurement of energy expenditure
- ▶  $\text{RQ} > 1$ 
  - ▶ Overfeeding
  - ▶ Lipogenesis
  - ▶ Treatment: reduce carbohydrate intake and caloric intake
- ▶  $\text{RQ} < 0.7$ 
  - ▶ ?

# Respiratory Quotient

- ▶  $\text{CO}_2$  produced:  $\text{O}_2$  consumed
  - ▶ Measurement of energy expenditure
- ▶  $\text{RQ} > 1$ 
  - ▶ Overfeeding
  - ▶ Lipogenesis
  - ▶ Treatment: reduce carbohydrate intake and caloric intake
- ▶  $\text{RQ} < 0.7$ 
  - ▶ Starvation
  - ▶ Ketosis
  - ▶ Treatment: increase carbohydrate and caloric intake
- ▶ Balanced nutrition:  $\text{RQ} 0.825$

# Nitrogen Balance

- ▶ N balance =  $N_{in} - N_{out}$
- ▶ 6.25g protein = 1g nitrogen
- ▶ N balance =  $(g \text{ protein} / 6.25) - (24h \text{ urine g nitrogen} + 4)$ 
  - ▶ Positive N balance
    - ▶ Anabolic
  - ▶ Negative N balance
    - ▶ Catabolic

# Quick hits

- ▶ Glutamine:
  - ▶ Fuel for enterocytes (small bowel)
- ▶ Short chain fatty acids
  - ▶ Fuel for colonocytes
- ▶ TPN vs PPN:
  - ▶ TPN glucose based, PPN fat based
- ▶ Increase in kcal requirement in lactation:
  - ▶ 500kcal/d
- ▶ Increase in kcal requirement in pregnancy:
  - ▶ 300kcal/d
